

## The One Great Argument

in favor of the BAKER STATIC MACHINE is its *versatility*. There is nothing in the range of Electro-Therapeutics that it will not accomplish more satisfactorily and economically than with any other method.

Type B Machine, Resonator and High Frequency Connection.

## Baker Static Machine

possesses the tremendous volume of energy of a Uni-directional character, essential to successful Radiographic work. Its ability to perform requirements of Coil and Static enables physicians to do all the work with one apparatus instead of two. Rotating plates are of fibrous material found in no other Static Machine. They are of extremely high insulation and guaranteed not to warp, crack or scale. Shafts and bearings are of highest mechanical perfection, which, in connection with the non-resonant revolving plates, explains the almost noiseless character of the machine when in action.
